

**Department of Electronics & Telecommunication Engineering****Experiment No.: THREE****Microcontroller & Applications****Name:****Batch/Rollno:****SAP ID:****Date:**

Objective:	Assembly language programming in simulation environment for AVR's microcontroller ATmega328p
Outcome:	Programs that demonstrate the understanding and use of instructions: LDS, STS, ADD, SUB, INC and DEC
Tasks/Problem Statement:	<ul style="list-style-type: none"> • Write a simple code to load values \$30 and \$97 into locations \$105 and \$106, respectively. • Write a simple code to load the value \$55 into locations \$300–\$308. • Write a simple code to load the value \$5F into the PORTB I/O register. • Write a simple code to (a) load the value \$11 into locations \$100–\$105, and (b) add the values together and place the result in R20 as they are added. • Repeat the above task, except place the result in location \$105 after the addition is done. • Write a simple code to (a) load the value \$15 into location \$100, and (b) add it to R19 five times and place the result in R19 as the values are added. R19 should be zero before the addition starts. • Repeat the above task except place the result in location \$100. • Write a simple code to complement the contents of location \$109 and place the result in R27. • Write a simple code to copy data from location \$110 to PORTC using R19
Programs, comments, brief explanation and output:	CODE AND OUTPUT:-

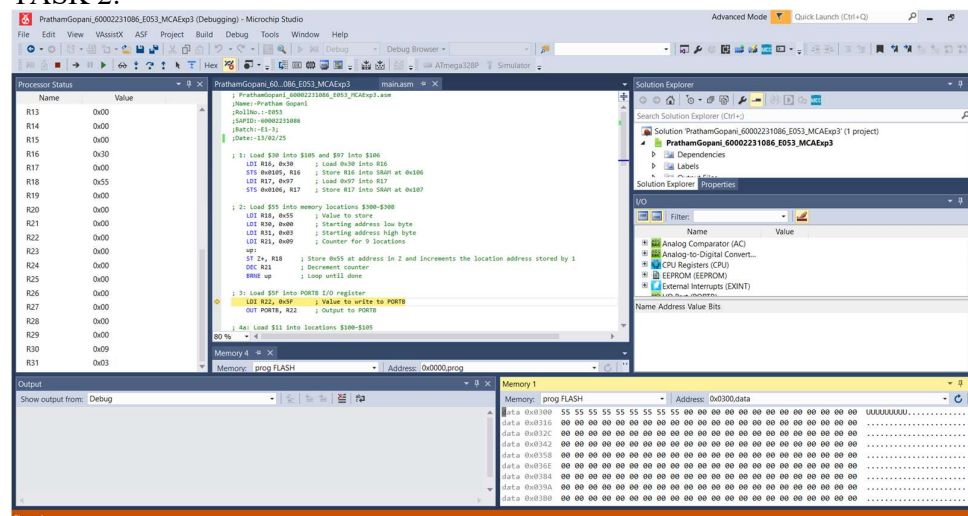

Department of Electronics & Telecommunication Engineering

1) Write a assembly language program to 16 bit addition of elements in a data block of 10 bytes using indirect addressing mode . The data block is starting from memory address 0x0200. Store the higher bit of the result in memory address 0x020A and lower bit on memory address 0x020B.

2) Write a assembly language program to 16 bit addition of elements in a data block of 10 bytes using direct addressing mode . The data block is starting from memory address 0x0200. Store the higher bit of the result in memory address 0x020A and lower bit on memory address 0x020B.

3) Write a assembly level program to add the contents of a data block of 10 bytes . Data block starts from memory location 0x0200. Store the result in memory loction 0x020A and 0x020B

Output window showing memory dump:

Address	0x0200	0x0201	0x0202	0x0203	0x0204	0x0205	0x0206	0x0207	0x0208	0x0209	0x020A	0x020B
data	53	38	43	50	56	62	54	37	43	29	02	73

Attach screen shots of the output

NOTE: Each code output should display student SAP id as well as Name of student along with date of performance.

Conclusion :

This experiment helped demonstrate low-level memory handling and register operations on AVR microcontrollers using key instructions like LDS, STS, ADD, INC, DEC, and OUT. It deepens understanding of how data is moved, manipulated, and interfaced with I/O in real-world embedded systems.
